

Conexple

Open consumer affiliate protocol on Solana

Pay loyal customers — not influencers

Bosso · Sornkan Co. · Bangkok, Thailand

suanwin.paows@gmail.com

The problem

- Global affiliate marketing: **\$17–18B annually**, growing ~14% YoY (Post Affiliate Pro, 2025)
- The entire pool flows to creators, publishers, coupon sites
- **0% reaches the customer** whose purchase generated the commission
- Merchants pay it anyway. The routing is wrong.

Why this is broken

- Influencers don't move the needle for most product categories
- Loyal customers refer friends — and get nothing back
- Existing loyalty programs don't compound across tiers
- The affiliate budget exists; the routing is wrong

Conexple — same budget, redistributed

- Every purchase splits into seven parts
- Five parts to the buyer's upline (five levels deep)
- One part funds a public, on-chain social pool
- One part is an Infinity Override for long-term active members
- Merchant pays nothing extra

Why this is not MLM

- 50% margin cap — enforced on-chain
- No recruitment requirement — earnings depend on purchases
- No auto-assign — placements only come from a referral
- 5-level depth cap — no infinite pyramid
- Apache 2.0 — forkable if the operator misbehaves

Mechanics — one purchase, traced

- Diagram of a leaf wallet's purchase flowing up 5 levels
- Each upline accrues a deterministic share
- Social pool catches the remainder
- All accruals visible on Solscan in real time

Why Solana

- Per-purchase commissions at sub-cent fees
- Daily settlement at near-zero gas
- USDC settlement matches merchant expectations
- Production RPC via Helius (Frontier's official partner) — mainnet is a config change
- This economic model doesn't work on Ethereum at this scale

Live demo — devnet, today

- Web: conexple-worker-web.sornwin.workers.dev
- 4 Anchor programs deployed, 21 positions across 3 trees, 4 merchants
- Total on-chain earnings distributed: 2,638 base units across 6 wallets
- BYOK proof: a third-party merchant plugged in end-to-end on chain

Architecture

- 4 Anchor programs: protocol, network, escrow, oracle
- Cloudflare Workers: operator backend + static web frontend
- D1 for off-chain mirror, KV for RPC cache, Queue for ingest
- Cron Trigger drives the daily settlement run

Market entry

- SEA influencer-driven e-commerce: **up to \$46B annually, \$21B directly trackable affiliate** (Cube × impact.com SEA Influencer Marketing Report, 2025)
- Thailand: **16% of SEA e-commerce, 83% buy on creator recommendation** (Priceza · Thailand E-Commerce Trends 2025)
- ASEAN arc: Thailand → Vietnam → Indonesia → Philippines
- First operator: Conexple Thailand (Sornkan Co.); 5 merchants Q3, 50 by year-end

Business model

- Operator takes 10% of social pool (configurable per network)
- No token launch
- Settlement currency: USDC (mainnet target — devnet uses mock)
- Protocol stays open; operators compete on UX

Compliance — Thai direct-selling law

- Designed against พ.ร.บ. ขายตรงฯ 2545
- No auto-assign of placements (legal red line)
- No recruitment-required qualification
- Margin cap and pool-distribution rules on-chain
- Submission opts into Public Goods award

Team

- Bosso — founder, designer + dev
- Sornkan Co. operates Thai consumer brands today
- We will operate Conexple Thailand as the first network
- The protocol stays open for any operator

Ask + close

- Repo: github.com/conexple/alpha (Apache 2.0)
- Demo: conexple-worker-web.sornwin.workers.dev
- Pitch video: see submission
- Ask: a Frontier slot, then accelerator conversation
- Open protocol. Thai-rooted. ASEAN-bound.
