

Conexple

Open consumer affiliate protocol on Solana

Pay loyal customers — not influencers

Same merchant budget, redirected on chain

Built from Bangkok · Apache 2.0

The problem

- Global affiliate marketing: **\$17–18B annually**, growing ~14% YoY (Post Affiliate Pro, 2025)
- The entire pool flows to creators, publishers, coupon sites
- **0% reaches the customer** whose purchase generated the commission
- Merchants pay it anyway. The routing is wrong.

Why this is broken

- Influencers don't move the needle for most product categories
- Loyal customers refer friends — and get nothing back
- Existing loyalty programs don't compound across tiers
- The affiliate budget exists; the routing is wrong

Conexple — same budget, redistributed

- Every purchase splits into seven parts
- Five parts to the buyer's upline (five levels deep)
- One part funds a public, on-chain social pool
- One part is an Infinity Override for long-term active members
- Merchant pays nothing extra

Direct Sale, on chain

- Direct sale is a legitimate, regulated commerce category — buyers refer buyers, get rewarded
- The problem has always been trust: no one verifies the margins, placements, or rules
- Conexple puts every guarantee on Solana — enforced in code, not paper
- **50% margin cap · earnings tied to purchases · placements only from referral**
- **5 levels deep, bounded · Apache 2.0, fork it anytime**

Mechanics — one purchase, traced

- Diagram of a leaf wallet's purchase flowing up 5 levels
- Each upline accrues a deterministic share
- Social pool catches the remainder
- All accruals visible on Solscan in real time

Why Solana

- Per-purchase commissions at sub-cent fees
- Daily settlement at near-zero gas
- USDC settlement matches merchant expectations
- Production RPC via Helius (Frontier's official partner) — mainnet is a config change
- This economic model doesn't work on Ethereum at this scale

Live demo — devnet, today

- Web: conexple-worker-web.sornwin.workers.dev
- 4 Anchor programs deployed, 21 positions across 3 trees, 6 merchants
- 3 deployer-signed + 3 BYOK (third-parties signed by their own keypairs)
- Total on-chain earnings: 6,417 base units distributed across the network
- Every accrual verifiable on Solscan in real time

Architecture

- 4 Anchor programs: protocol, network, escrow, oracle
- Cloudflare Workers: operator backend + static web frontend
- D1 for off-chain mirror, KV for RPC cache, Queue for ingest
- Cron Trigger drives the daily settlement run

Market entry

- SEA influencer-driven e-commerce: **up to \$46B annually, \$21B directly trackable affiliate** (Cube × impact.com SEA Influencer Marketing Report, 2025)
- Thailand: **16% of SEA e-commerce, 83% buy on creator recommendation** (Priceza · Thailand E-Commerce Trends 2025)
- ASEAN arc: Thailand → Vietnam → Indonesia → Philippines
- First operator: Conexple Thailand; 5 merchants Q3, 50 by year-end

Business model

- Operator takes 10% of social pool (configurable per network)
- No token launch
- Settlement currency: USDC (mainnet target — devnet uses mock)
- Protocol stays open; operators compete on UX

Compliance — Thai direct-selling law

- Designed against Thailand's Direct Selling Act (B.E. 2545 / 2002)
- No auto-assign of placements (legal red line)
- No recruitment-required qualification
- Margin cap and pool-distribution rules on-chain
- Submission opts into Public Goods award

Team & operating plan

- Conexple Thailand will run as the first operator network
- Operating team is based in Bangkok, with consumer commerce experience
- The protocol stays open — Apache 2.0, no token, forkable
- Anyone can run their own Conexple network on the same Solana programs

Try Conexple — live on devnet

- **conexple-worker-web.sornwin.workers.dev** — connect a wallet, see splits in real time
- Repo: github.com/conexple/alpha (Apache 2.0)
- Opting into Public Goods award · Thai-rooted, ASEAN-bound
- Mainnet next; Conexple Thailand as first operator network
- Protocol stays open — fork it, run your own
